

ABSTRACT

A data stream may be processed using a computer system by receiving the data stream using a browser application, detecting a content type of data in the data stream, temporarily overriding a default rendering process otherwise associated with the content type detected for the data in the data stream by associating a particular rendering process with the data stream based on the type of data in the data stream, and routing the data stream to the particular rendering process. The default rendering process may be identified in a registry of the computer system. It may be temporarily overridden by discriminating among internal and external instances of the browser application used to receive the data stream, and temporarily overriding the default rendering process only if the browser application is an internal instance.
